

Public sector

Technology for public entities, with figures you can verify.

Six common problems in digital services, each with its figure and its source, and the method we use to solve them.

Context

Colombia already has an artificial intelligence policy.

CONPES 4144, approved on 14 February 2025, sets the National Artificial Intelligence Policy: 106 actions through 2030 with a total investment of about COP 479,273 million.

[National Planning Department \(DNP\), CONPES 4144, 2025 ↗](#)

Six problems

**What we see in
digital services, with
the figure behind it.**

1. Slow services that people abandon

53%

of visits are abandoned if a mobile site takes more than three seconds to load.

[Google, The Need for Mobile Speed, 2016](#)

17%

of US online shoppers have abandoned an order because of a checkout process that was too long or complicated.

[Baymard Institute, accessed September 2026](#)

2. Costly service channels

Almost 20 times

lower is the cost of a digital transaction than a telephone one for some UK government services; about 30 times lower than post and about 50 times lower than face to face.

[UK Government, Digital Efficiency Report, 2012](#)

3. Features nobody uses

80%

of features in the average software product are rarely or never used.

[Pendo, Feature Adoption Report, 2019](#)

4. Outages and exposed data

USD 400 billion

a year is what downtime costs Global 2000 companies, 9% of their profits.

[Splunk and Oxford Economics, The Hidden Costs of Downtime, 2024](#)

USD 4.99 million

is the global average cost of a data breach, a record high.

[IBM, Cost of a Data Breach, 2026 edition](#)

5. Resources in the wrong place

USD 1.77 trillion

is what inventory distortion cost retailers worldwide in 2023: products sold out in one place and left over in another.

[IHL Group, 2023](#)

6. Low adoption of artificial intelligence

23.82%

of 5,034 public entities said they had used artificial intelligence in digital innovation processes (FURAG 2022, cited in CONPES 4144).

[National Planning Department \(DNP\), CONPES 4144, 2025](#)

Every figure links to its source. Third party figures describe the market; they are not Lumintik results.

Four steps, each with a deliverable.

1

Assessment

We review the service, the data and the current systems. We deliver the problem, measured, and a proposal with scope, risks and costs.

2

Pilot

We build a scoped version with real users and measure it against the assessment baseline.

3

Scale

We take what worked to more users, offices or procedures, with three environments and controlled deployments.

4

Operation

We run and improve the service with telemetry and support, and hand the knowledge over to the entity's team.

**The same good
practices in
every project.**

TLS 1.3 and AES 256 encryption, least privilege access with an audit log, three environments, telemetry from day one, WCAG 2.2 accessibility and compliance with Colombia's Law 1581 on personal data.

Software engineering built to
run at real scale.
